Library Book Management System

React SPA + Laravel REST API + MySQL

Presented by: [Your Full Name] | Client: [Your Library / School Name]

Mini Capstone - Course 4: React Fundamentals with Laravel as Backend

The Client's Problem

Goal: one online system for the librarian and the members

- Books are tracked on paper logbooks and spreadsheets
- No quick way to see which books are available
- Borrow requests are verbal - nothing is recorded
- Overdue books are noticed late; no summary reports

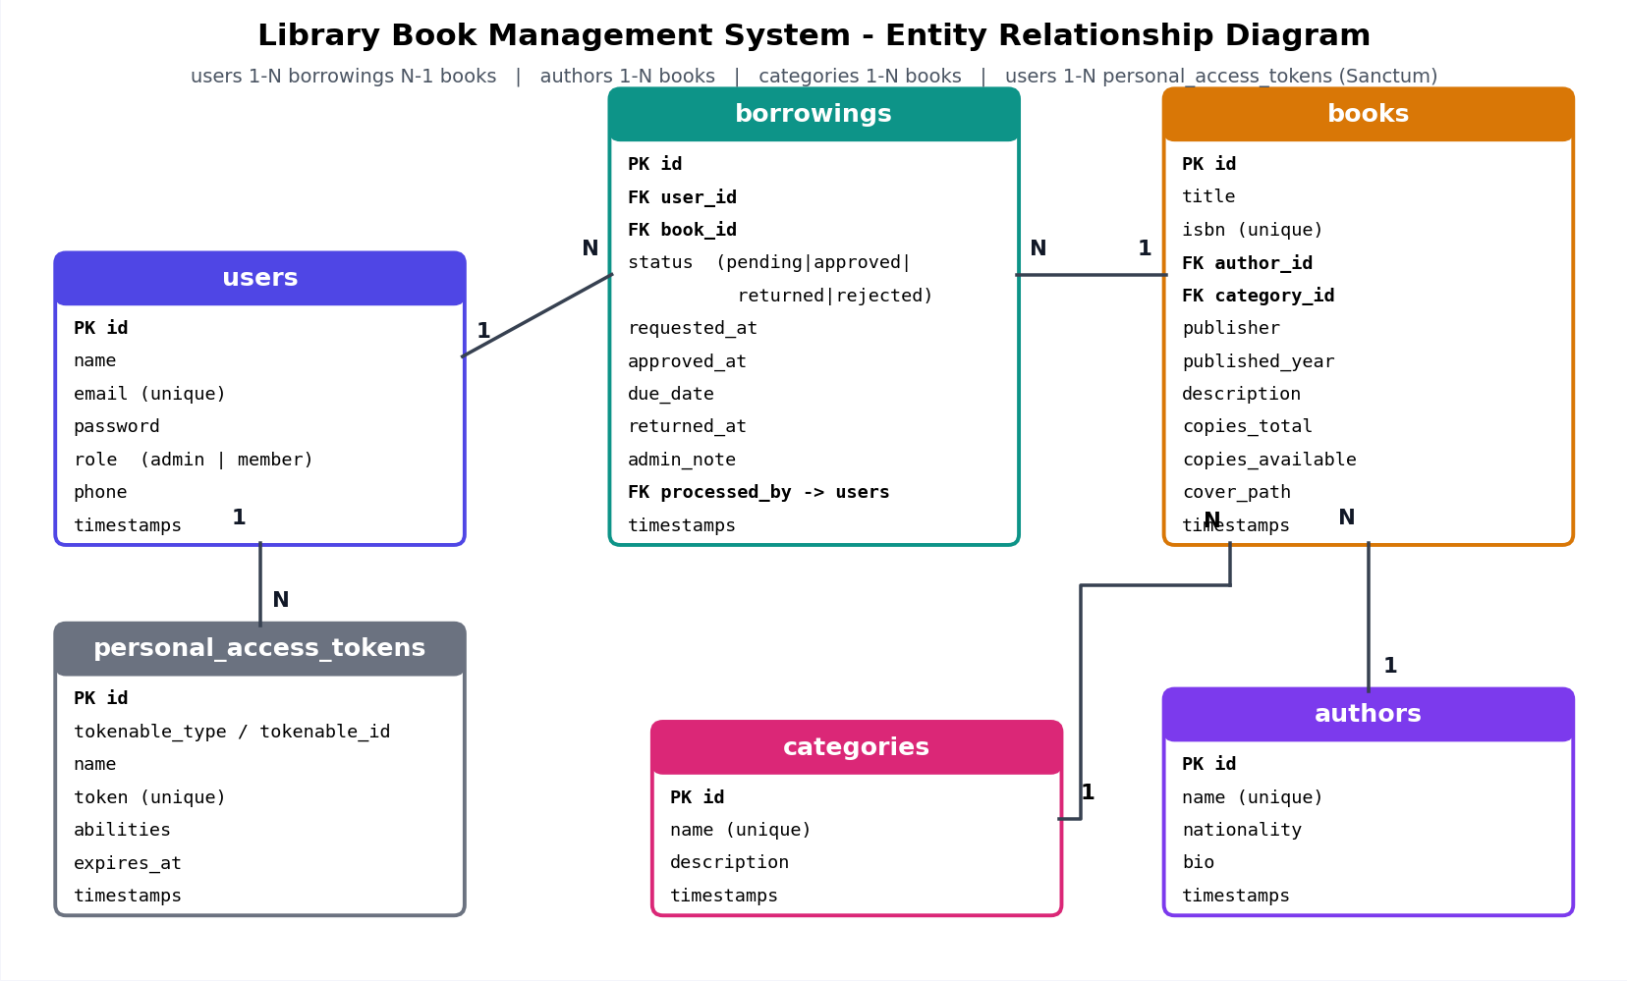

Users and Features Delivered

- Admin / Librarian: manage books, authors, categories
- Admin: approve, reject and close borrowing requests
- Member: browse, search and request books online
- Member: track own requests, due dates and history
- Dashboard figures and charts for both roles

How the System Works

Three simple parts that talk to each other

1. React website (what users see) -> 2. Laravel API (the rules + security) -> 3. MySQL database

Live Demo Scenario

Follow one real borrowing from request to return

- A member searches the catalog and requests a book
- The librarian sees it on the dashboard and approves it
- The member sees "Approved" with a due date
- The librarian marks the book returned; copies update
- Validation, search, pagination and the dashboard shown

Security and Data Quality

- Login with secure API tokens (Laravel Sanctum)
- Admin pages hidden in React AND blocked by the API
- Validation in the forms and on the server
- Confirm step before any delete
- Members can only see their own borrowing records

Handover

- GitHub repository with backend/ and frontend/ folders
- README: install and run in a few commands
- Demo accounts: admin@library.test / member@library.test
- API documentation: Postman collection in /docs
- Demo video and screenshots included

Delivered vs. Proposed, and Phase 2

Thank you!

- Delivered: every feature in the Day 2 proposal
- Known limits: no email notices, no fines, no reservations
- Phase 2: email reminders for due dates
- Phase 2: fines, book reservations, barcode scanning
- Phase 2: deploy online with daily database backups
